

# CS6013 Assignment 1

## 1. Regular Expressions and DFA

Draw DFAs for the following languages (5 + 5 + 5)

- (a)  $L = \{w \in \{0, 1, 2, 3, 4\}^* \mid w \text{ has no repeated digits}\}$
- (b)  $L = \{w \in \{1, 2, 3\}^* \mid \text{Number of 2s modulo 2 equal the number of 3s modulo 3}\}$
- (c)  $L = \{w \in \{fopen, fclose, fread, fwrite\}^* \mid w \text{ denotes a sequence of valid file operations}\}$ .

Bonus: Write the equivalent REs. (10)

## 2. CFG

Write the CFG for the following language: (5 + 5 + 5)

- (a)  $L = \{w \in \{0, 1\}^* \mid w \text{ contains equal number of 0s and 1s}\}$ .
- (b)  $L = \{w \in \{0, 1\}^* \mid w \text{ contains unequal number of 0s and 1s}\}$ .
- (c)  $L = \{w \in \{push, pop, top\}^* \mid w \text{ denotes a sequence of valid stack operations}\}$ .

## 3. Parsing

LL(1) Grammar (30), Parser Implementation (40).

Consider the grammar

```
stmt ... = id() | stmt ; stmt | { stmt } | if (id) stmt else stmt
where stmt is the only non-terminal symbol, stmt is the start symbol, and
id ( ) ; { } if else
```

is the list of terminal symbols. The terminal symbol `id` is defined using the regular expression `(letter+)` where `letter` is an ascii character in the interval `a...z`. The grammar generates a subset of the Java statements. Rewrite the grammar into a grammar which is LL(1), and use the rewritten grammar as the basis for implementing a recursive descent parser; write the LL(1) grammar, the FIRST and FOLLOW sets for each nonterminal symbol, and the predictive parsing table, together with an argument that the grammar is LL(1).
