CS3300 Quiz 1: Sep 05, 2023. (QP Code: A)

Maximum marks = 30, Time: 45 minutes, Closed Book, Closed Neighbor

Name: _

Roll: _

Read the instructions and questions carefully. You can use the given booklet for rough work and stating any reasonable assumptions you make. But write the answers in the QP itself – marks will be given based on the answers in the QP.

- MCQ and True/False questions: Each incorrect answer will lead to a deduction of 0.5 marks.
- MSQ questions:
 - If you choose any wrong option you will get a 0 for that question.
 - If you choose only a subset of the correct options: you will get proportional marks.

Section 1. Lexical Analysis, 2 marks each

- 1. Which of the following is/are true about LL(1) grammars?
 - (a) Left recursive grammars are not LL(1).
 - (b) Some LL(1) grammars may be ambiguous.
 - (c) A language that has no LL(1) grammar is ambiguous.
 - (d) Left factoring and left recursive removal can be used to convert any grammar to LL(1).
- 2. The key decision(s) in bottom-up parsing is/are:
 - (a) When to reduce?
 - (b) What production rules to apply for reduction?
 - (c) Which non-terminal to use?
 - (d) Which terminals to process?
- 3. Which of the following is/are NOT a valid token-type(s):
 - (a) Type of a variable
 - (b) scope of a variable
 - (c) operator
 - (d) loop
- 4. Which of the following is/are true with respect to regular expressions:
 - (a) ϵ is a regular expression.
 - (b) Each regular expression derives unique set of strings.
 - (c) Given a finite alphabet L the number of regular expressions over L is finite.
 - (d) Every regular expression must derived at least two strings.
- 5. Which of the following is/are possible attribute-values(s) for lexemes:
 - (a) line number
 - (b) type of a variable
 - (c) operator associativity
 - (d) loop
- 6. Given a production of the form $A \rightarrow \beta$, if β has k symbols (terminals and non-terminals), then how many LR(0) items can the production generate?
 - (a) k 1
 - (b) *k*
 - (c) k+1
 - (d) Depends on the input

$ \begin{array}{c} \text{Con} \\ I_0. \\ 1. \\ \text{The} \\ \text{set} \\ \hline \end{array} $	nsider the grammar and state e number of elements in the returned by $GOTO(I_0, E) =$	$ \begin{array}{c} 1 \\ 2 \\ 3 \\ 4 \\ 6 \\ 7 \end{array} $	$\begin{array}{cccccccccccccccccccccccccccccccccccc$	E E + T ET T Id (E)		$I_0: S \to \bullet E \$$ $E \to \bullet E + T$ $E \to \bullet E T$ $E \to \bullet T$ $T \to \bullet Id$ $T \to \bullet (E)$

Cor 4. The tab	nsider the DFA shown to the right. e number of non-error entries in the ble are $=$	nex	tState	> 0 l dig otr	etter 1 git	accept

Section 2. Fill in the blank, 3 marks each

Section 3. True or False Answers, 1 mark each

Given an input consisting of m terminals, the LR parsing technique for a grammar with n non-terminals, shifts m + n number of times.

The closure of an item can be a singleton set.

In an LL(1) grammar with no epsilon productions, the FIRST and FOLLOW sets of a non-terminal may have no common elements.

Lexical analysis can be used infer the type of each variable.

A compiler can use error recovery techniques to fix the errors in a program and generate the correct machine-code.

Regular expressions can be used to ensure that all variables are of lower case only.
