- Recurrences and its applications ✓
- Solving Recurrences

## Recap: Solving recurrences

### We have seen

- Method of Repeated Substitution.
- Linear Homogeneous recurrence relations of degree two with constant coefficients.
- Use of characteristic equation to solve these recurrences.

## Recap: Solving recurrences

### We have seen

- Method of Repeated Substitution.
  - Linear Homogeneous recurrence relations of degree two with constant coefficients.
  - Use of characteristic equation to solve these recurrences.
- 

### Today:

- What if roots are not distinct?
- How does this generalize beyond degree two?
- Beyond degree two with repeated roots.

# Revisiting Distinct Roots case

## Revisiting Distinct Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and let the equation  $t^2 - c_1t - c_2 = 0$  have two distinct roots  $r_1$  and  $r_2$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 r_1^n + \alpha_2 r_2^n$$

---

## Revisiting Distinct Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and let the equation  $t^2 - c_1t - c_2 = 0$  have two distinct roots  $r_1$  and  $r_2$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 r_1^n + \alpha_2 r_2^n$$

- 
- We used this claim to solve these special recurrences.
  - We did **not prove** the claim.

## Revisiting Distinct Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and let the equation  $t^2 - c_1t - c_2 = 0$  have two distinct roots  $r_1$  and  $r_2$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 r_1^n + \alpha_2 r_2^n$$

- 
- We used this claim to solve these special recurrences.
  - We did **not prove** the claim. (see [Theorem 1 Section 8.2 \[KR\]](#))

## Revisiting Distinct Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and let the equation  $t^2 - c_1t - c_2 = 0$  have two distinct roots  $r_1$  and  $r_2$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 r_1^n + \alpha_2 r_2^n$$

- 
- We used this claim to solve these special recurrences.
  - We did **not prove** the claim. (see Theorem 1 Section 8.2 [KR])
  - Check out where the theorem does **not hold** for the single roots case.

# Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

## Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

- The characteristic equation is  $t^2 - 4t + 4 = 0$

## Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

- The characteristic equation is  $t^2 - 4t + 4 = 0$  with a **single** root  $r = 2$ .

## Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

- The characteristic equation is  $t^2 - 4t + 4 = 0$  with a **single** root  $r = 2$ .
- Observe that  $1, 2, 2^2, 2^3, \dots$ , is a sequence that satisfies the recurrence,

## Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

- The characteristic equation is  $t^2 - 4t + 4 = 0$  with a **single** root  $r = 2$ .
- Observe that  $1, 2, 2^2, 2^3, \dots$ , is a sequence that satisfies the recurrence, **but not the base cases**.

## Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

- The characteristic equation is  $t^2 - 4t + 4 = 0$  with a **single** root  $r = 2$ .
- Observe that  $1, 2, 2^2, 2^3, \dots$ , is a sequence that satisfies the recurrence, **but not the base cases**.
- However, we need one more solution (even if it does not satisfy the base cases) to obtain the final solution.

## Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

- The characteristic equation is  $t^2 - 4t + 4 = 0$  with a **single** root  $r = 2$ .
- Observe that  $1, 2, 2^2, 2^3, \dots$ , is a sequence that satisfies the recurrence, **but not the base cases**.
- However, we need one more solution (even if it does not satisfy the base cases) to obtain the final solution.
- We observe that  $0, 2, 8, 24, 64, \dots$ , is also a sequence that satisfies the recurrence, again not the base cases.

## Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

- The characteristic equation is  $t^2 - 4t + 4 = 0$  with a **single** root  $r = 2$ .
- Observe that  $1, 2, 2^2, 2^3, \dots$ , is a sequence that satisfies the recurrence, **but not the base cases**.
- However, we need one more solution (even if it does not satisfy the base cases) to obtain the final solution.
- We observe that  $0, 2, 8, 24, 64, \dots$ , is also a sequence that satisfies the recurrence, again not the base cases.  
In fact the above sequence is  $0 \cdot 2^0, 1 \cdot 2^1, 2 \cdot 2^2, \dots, i \cdot 2^i, \dots$ ,

## Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

- The characteristic equation is  $t^2 - 4t + 4 = 0$  with a **single** root  $r = 2$ .
- Observe that  $1, 2, 2^2, 2^3, \dots$ , is a sequence that satisfies the recurrence, **but not the base cases**.
- However, we need one more solution (even if it does not satisfy the base cases) to obtain the final solution.
- We observe that  $0, 2, 8, 24, 64, \dots$ , is also a sequence that satisfies the recurrence, again not the base cases.  
In fact the above sequence is  $0 \cdot 2^0, 1 \cdot 2^1, 2 \cdot 2^2, \dots, i \cdot 2^i, \dots$ ,
- Now that we have two sequences  $2^n$  and  $n \cdot 2^n$  satisfying the recurrence relation (without base cases), we use our earlier idea.  
That is,  $\alpha_1 2^n + \alpha_2 n \cdot 2^n$  satisfies the recurrence.

## Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

- The characteristic equation is  $t^2 - 4t + 4 = 0$  with a **single** root  $r = 2$ .
- Observe that  $1, 2, 2^2, 2^3, \dots$ , is a sequence that satisfies the recurrence, **but not the base cases**.
- However, we need one more solution (even if it does not satisfy the base cases) to obtain the final solution.
- We observe that  $0, 2, 8, 24, 64, \dots$ , is also a sequence that satisfies the recurrence, again not the base cases.  
In fact the above sequence is  $0 \cdot 2^0, 1 \cdot 2^1, 2 \cdot 2^2, \dots, i \cdot 2^i, \dots$ ,
- Now that we have two sequences  $2^n$  and  $n \cdot 2^n$  satisfying the recurrence relation (without base cases), we use our earlier idea.  
That is,  $\alpha_1 2^n + \alpha_2 n \cdot 2^n$  satisfies the recurrence.
- Finally we use base cases to determine,  $\alpha_1 = 1$  and  $\alpha_2 = \frac{1}{2}$ .

## Example 1

$$a_n = 4a_{n-1} - 4a_{n-2}$$

$$a_0 = 1; \quad a_1 = 3$$

- The characteristic equation is  $t^2 - 4t + 4 = 0$  with a **single** root  $r = 2$ .
- Observe that  $1, 2, 2^2, 2^3, \dots$ , is a sequence that satisfies the recurrence, **but not the base cases**.
- However, we need one more solution (even if it does not satisfy the base cases) to obtain the final solution.
- We observe that  $0, 2, 8, 24, 64, \dots$ , is also a sequence that satisfies the recurrence, again not the base cases.  
In fact the above sequence is  $0 \cdot 2^0, 1 \cdot 2^1, 2 \cdot 2^2, \dots, i \cdot 2^i, \dots$ .
- Now that we have two sequences  $2^n$  and  $n \cdot 2^n$  satisfying the recurrence relation (without base cases), we use our earlier idea.  
That is,  $\alpha_1 2^n + \alpha_2 n \cdot 2^n$  satisfies the recurrence.
- Finally we use base cases to determine,  $\alpha_1 = 1$  and  $\alpha_2 = \frac{1}{2}$ .

Qn: Does it hold in general?

# Single Roots case

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1):** Assume  $r$  is a single root of the characteristic equation. Let  $\alpha_1$  and  $\alpha_2$  be constants.

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1):** Assume  $r$  is a single root of the characteristic equation. Let  $\alpha_1$  and  $\alpha_2$  be constants.

**To prove:** The sequence given by  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$  satisfies the recurrence  $a_n = c_1a_{n-1} + c_2a_{n-2}$ .

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1):** Assume  $r$  is a single root of the characteristic equation. Let  $\alpha_1$  and  $\alpha_2$  be constants.

**To prove:** The sequence given by  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$  satisfies the recurrence  $a_n = c_1a_{n-1} + c_2a_{n-2}$ .

Since  $r$  is a root of  $t^2 - c_1t - c_2 = 0$ , we have  $r^2 = c_1r + c_2$ .

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1):** Assume  $r$  is a single root of the characteristic equation. Let  $\alpha_1$  and  $\alpha_2$  be constants.

**To prove:** The sequence given by  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$  satisfies the recurrence  $a_n = c_1a_{n-1} + c_2a_{n-2}$ .

Since  $r$  is a root of  $t^2 - c_1t - c_2 = 0$ , we have  $r^2 = c_1r + c_2$ . Consider

$$c_1a_{n-1} + c_2a_{n-2}$$

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1):** Assume  $r$  is a single root of the characteristic equation. Let  $\alpha_1$  and  $\alpha_2$  be constants.

**To prove:** The sequence given by  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$  satisfies the recurrence  $a_n = c_1a_{n-1} + c_2a_{n-2}$ .

Since  $r$  is a root of  $t^2 - c_1t - c_2 = 0$ , we have  $r^2 = c_1r + c_2$ . Consider

$$c_1a_{n-1} + c_2a_{n-2} = c_1 \left( \alpha_1 r^{n-1} + \alpha_2 (n-1)r^{n-1} \right) + c_2 \left( \alpha_1 r^{n-2} + \alpha_2 (n-2)r^{n-2} \right)$$

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1):** Assume  $r$  is a single root of the characteristic equation. Let  $\alpha_1$  and  $\alpha_2$  be constants.

**To prove:** The sequence given by  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$  satisfies the recurrence  $a_n = c_1a_{n-1} + c_2a_{n-2}$ .

Since  $r$  is a root of  $t^2 - c_1t - c_2 = 0$ , we have  $r^2 = c_1r + c_2$ . Consider

$$\begin{aligned} c_1a_{n-1} + c_2a_{n-2} &= c_1 \left( \alpha_1 r^{n-1} + \alpha_2 (n-1) r^{n-1} \right) + c_2 \left( \alpha_1 r^{n-2} + \alpha_2 (n-2) r^{n-2} \right) \\ &= \alpha_1 \left( c_1 r^{n-1} + c_2 r^{n-2} \right) + \alpha_2 \left( c_1 (n-1) r^{n-1} + c_2 (n-2) r^{n-2} \right) \end{aligned}$$

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1):** Assume  $r$  is a single root of the characteristic equation. Let  $\alpha_1$  and  $\alpha_2$  be constants.

**To prove:** The sequence given by  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$  satisfies the recurrence  $a_n = c_1a_{n-1} + c_2a_{n-2}$ .

Since  $r$  is a root of  $t^2 - c_1t - c_2 = 0$ , we have  $r^2 = c_1r + c_2$ . Consider

$$\begin{aligned}c_1a_{n-1} + c_2a_{n-2} &= c_1 \left( \alpha_1 r^{n-1} + \alpha_2 (n-1)r^{n-1} \right) + c_2 \left( \alpha_1 r^{n-2} + \alpha_2 (n-2)r^{n-2} \right) \\ &= \alpha_1 \left( c_1 r^{n-1} + c_2 r^{n-2} \right) + \alpha_2 \left( c_1 (n-1)r^{n-1} + c_2 (n-2)r^{n-2} \right) \\ &= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 r (n-1) + c_2 (n-2))\end{aligned}$$

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1):** Assume  $r$  is a single root of the characteristic equation. Let  $\alpha_1$  and  $\alpha_2$  be constants.

**To prove:** The sequence given by  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$  satisfies the recurrence  $a_n = c_1a_{n-1} + c_2a_{n-2}$ .

Since  $r$  is a root of  $t^2 - c_1t - c_2 = 0$ , we have  $r^2 = c_1r + c_2$ . Consider

$$\begin{aligned}c_1a_{n-1} + c_2a_{n-2} &= c_1 \left( \alpha_1 r^{n-1} + \alpha_2 (n-1)r^{n-1} \right) + c_2 \left( \alpha_1 r^{n-2} + \alpha_2 (n-2)r^{n-2} \right) \\ &= \alpha_1 \left( c_1 r^{n-1} + c_2 r^{n-2} \right) + \alpha_2 \left( c_1 (n-1)r^{n-1} + c_2 (n-2)r^{n-2} \right) \\ &= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 r (n-1) + c_2 (n-2)) \\ &= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 r n + c_2 n - (c_1 r + 2c_2))\end{aligned}$$

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1 continued):** Consider

$$\begin{aligned} c_1a_{n-1} + c_2a_{n-2} &= c_1 \left( \alpha_1 r^{n-1} + \alpha_2 (n-1)r^{n-1} \right) + c_2 \left( \alpha_1 r^{n-2} + \alpha_2 (n-2)r^{n-2} \right) \\ &= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 n + c_2 n - (c_1 r + 2c_2)) \end{aligned}$$

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1 continued):** Consider

$$\begin{aligned}c_1a_{n-1} + c_2a_{n-2} &= c_1 \left( \alpha_1 r^{n-1} + \alpha_2 (n-1)r^{n-1} \right) + c_2 \left( \alpha_1 r^{n-2} + \alpha_2 (n-2)r^{n-2} \right) \\ &= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 n + c_2 n - (c_1 r + 2c_2))\end{aligned}$$

---

Recall we are in the single roots case. Therefore,

$$c_1^2 + 4 \cdot c_2 = 0 \quad \text{and} \quad r = \frac{c_1}{2}$$

Use the fact that we are in the single roots case to show  $c_1 r + 2c_2 = 0$ .

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1 continued):** Consider

$$\begin{aligned}c_1a_{n-1} + c_2a_{n-2} &= c_1 \left( \alpha_1 r^{n-1} + \alpha_2 (n-1)r^{n-1} \right) + c_2 \left( \alpha_1 r^{n-2} + \alpha_2 (n-2)r^{n-2} \right) \\ &= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 n + c_2 n - (c_1 r + 2c_2)) \\ &= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 n + c_2 n)\end{aligned}$$

---

Recall we are in the single roots case. Therefore,

$$c_1^2 + 4 \cdot c_2 = 0 \quad \text{and} \quad r = \frac{c_1}{2}$$

Use the fact that we are in the single roots case to show  $c_1 r + 2c_2 = 0$ .

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1 continued):** Consider

$$\begin{aligned}c_1a_{n-1} + c_2a_{n-2} &= c_1 \left( \alpha_1 r^{n-1} + \alpha_2 (n-1)r^{n-1} \right) + c_2 \left( \alpha_1 r^{n-2} + \alpha_2 (n-2)r^{n-2} \right) \\ &= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 n + c_2 n - (c_1 r + 2c_2)) \\ &= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 n + c_2 n) \\ &= \alpha_1 r^{n-2} \cdot r^2 + \alpha_2 r^{n-2} \cdot n \cdot r^2 = \alpha_1 r^n + \alpha_2 \cdot n \cdot r^n = a_n\end{aligned}$$

---

Recall we are in the single roots case. Therefore,

$$c_1^2 + 4 \cdot c_2 = 0 \quad \text{and} \quad r = \frac{c_1}{2}$$

Use the fact that we are in the single roots case to show  $c_1 r + 2c_2 = 0$ .

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 1 continued):** Consider

$$\begin{aligned}c_1a_{n-1} + c_2a_{n-2} &= c_1 \left( \alpha_1 r^{n-1} + \alpha_2 (n-1)r^{n-1} \right) + c_2 \left( \alpha_1 r^{n-2} + \alpha_2 (n-2)r^{n-2} \right) \\&= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 n + c_2 n - (c_1 r + 2c_2)) \\&= \alpha_1 r^{n-2} (c_1 r + c_2) + \alpha_2 r^{n-2} (c_1 n + c_2 n) \\&= \alpha_1 r^{n-2} \cdot r^2 + \alpha_2 r^{n-2} \cdot n \cdot r^2 = \alpha_1 r^n + \alpha_2 \cdot n \cdot r^n = a_n\end{aligned}$$

Hence proved

---

Recall we are in the single roots case. Therefore,

$$c_1^2 + 4 \cdot c_2 = 0 \quad \text{and} \quad r = \frac{c_1}{2}$$

Use the fact that we are in the single roots case to show  $c_1 r + 2c_2 = 0$ .

# Single Roots case

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 2):** We now prove that for every solution  $a_0, a_1, \dots$  to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  with base cases as  $a_0 = x$  and  $a_1 = y$ , there exists constants  $\alpha_1$  and  $\alpha_2$  such that  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$ .

Using the base cases, we note that

$$x = \alpha_1 r^0 + \alpha_2 \cdot 0 \cdot r^0 \implies \alpha_1 = x$$

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 2):** We now prove that for every solution  $a_0, a_1, \dots$  to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  with base cases as  $a_0 = x$  and  $a_1 = y$ , there exists constants  $\alpha_1$  and  $\alpha_2$  such that  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$ .

Using the base cases, we note that

$$x = \alpha_1 r^0 + \alpha_2 \cdot 0 \cdot r^0 \implies \alpha_1 = x$$

$$y = \alpha_1 r^1 + \alpha_2 \cdot 1 \cdot r^1$$

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 2):** We now prove that for every solution  $a_0, a_1, \dots$  to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  with base cases as  $a_0 = x$  and  $a_1 = y$ , there exists constants  $\alpha_1$  and  $\alpha_2$  such that  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$ .

Using the base cases, we note that

$$\begin{aligned}x &= \alpha_1 r^0 + \alpha_2 \cdot 0 \cdot r^0 \implies \alpha_1 = x \\y &= \alpha_1 r^1 + \alpha_2 \cdot 1 \cdot r^1 \implies \alpha_2 = \frac{y - x \cdot r}{r}\end{aligned}$$

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 2):** We now prove that for every solution  $a_0, a_1, \dots$  to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  with base cases as  $a_0 = x$  and  $a_1 = y$ , there exists constants  $\alpha_1$  and  $\alpha_2$  such that  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$ .

Using the base cases, we note that

$$\begin{aligned}x &= \alpha_1 r^0 + \alpha_2 \cdot 0 \cdot r^0 \implies \alpha_1 = x \\y &= \alpha_1 r^1 + \alpha_2 \cdot 1 \cdot r^1 \implies \alpha_2 = \frac{y - x \cdot r}{r}\end{aligned}$$

Clearly, for this choice of constants  $\alpha_1 r^n + \alpha_2 n r^n$  satisfies the base cases.

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 2):** We now prove that for every solution  $a_0, a_1, \dots$  to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  with base cases as  $a_0 = x$  and  $a_1 = y$ , there exists constants  $\alpha_1$  and  $\alpha_2$  such that  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$ .

Using the base cases, we note that

$$\begin{aligned}x &= \alpha_1 r^0 + \alpha_2 \cdot 0 \cdot r^0 \implies \alpha_1 = x \\y &= \alpha_1 r^1 + \alpha_2 \cdot 1 \cdot r^1 \implies \alpha_2 = \frac{y - x \cdot r}{r}\end{aligned}$$

Clearly, for this choice of constants  $\alpha_1 r^n + \alpha_2 n r^n$  satisfies the base cases.

Now, we note that  $a_0, a_1, a_2, \dots$  is a solution to the recurrence (by assumption).

## Single Roots case

**Claim:** Let  $c_1$  and  $c_2$  be constants and the equation  $t^2 - c_1t - c_2 = 0$  have **single** root  $r$ . The sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  iff for constants  $\alpha_1$  and  $\alpha_2$ , we have

$$a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$$

---

**Proof (Part 2):** We now prove that for every solution  $a_0, a_1, \dots$  to the recurrence relation  $a_n = c_1a_{n-1} + c_2a_{n-2}$  with base cases as  $a_0 = x$  and  $a_1 = y$ , there exists constants  $\alpha_1$  and  $\alpha_2$  such that  $a_n = \alpha_1 \cdot r^n + \alpha_2 \cdot n \cdot r^n$ .

Using the base cases, we note that

$$\begin{aligned}x &= \alpha_1 r^0 + \alpha_2 \cdot 0 \cdot r^0 \implies \alpha_1 = x \\y &= \alpha_1 r^1 + \alpha_2 \cdot 1 \cdot r^1 \implies \alpha_2 = \frac{y - x \cdot r}{r}\end{aligned}$$

Clearly, for this choice of constants  $\alpha_1 r^n + \alpha_2 n r^n$  satisfies the base cases.

Now, we note that  $a_0, a_1, a_2, \dots$  is a solution to the recurrence (by assumption). Further, note that for a linear homogeneous recurrence relation of degree two with two base cases, has a **unique solution**.

We have already shown (in Part 1) that for some constants  $\alpha_1$  and  $\alpha_2$  the formula  $\alpha_1 r^n + \alpha_2 n r^n$  satisfies the recurrence. Thus, the two sequences are the **same** and hence  $a_n = c_1 a_{n-1} + c_2 a_{n-2} = \alpha_1 r^n + \alpha_2 n r^n$  for all  $n \geq 0$ .

## Example 2

**Ex:** Consider the following **finite** recursive sequence containing  $M + 1$  terms.

$$a_n = 2a_{n-1} - a_{n-2}$$

$$a_0 = 1; \quad a_M = 0$$

## Example 2

**Ex:** Consider the following **finite** recursive sequence containing  $M + 1$  terms.

$$\begin{aligned}a_n &= 2a_{n-1} - a_{n-2} \\ a_0 &= 1; \quad a_M = 0\end{aligned}$$

- Note that the two values given are first and the last terms.
- Can you compute a closed form expression for the  $n$ -th term where  $0 \leq n \leq M$ ?

**iff** for  $n = 0, 1, 2$ , we have the following, where  $\alpha_i$ s are constants.

$$a_n = \alpha_1 r_1^n + \alpha_2 r_2^n + \dots + \alpha_k r_k^n$$

---

We show the claim applied to an example.

## Example 3

$$a_n = 4a_{n-2} + 4a_{n-3} - a_{n-1}$$

$$a_0 = 8 \quad a_1 = 6 \quad a_2 = 26$$

**Ex:** Apply the above claim and get the closed form expression.

## Example 3

$$a_n = 4a_{n-2} + 4a_{n-3} - a_{n-1}$$

$$a_0 = 8 \quad a_1 = 6 \quad a_2 = 26$$

**Ex:** Apply the above claim and get the closed form expression.

---

**Sol:**

- Characteristic equation is:  $t^3 + t^2 - 4t - 4 = 0$ .
- Roots are  $r_1 = -1, r_2 = -2, r_3 = 2$ .
- Thus,  $a_n = \alpha_1(-1)^n + \alpha_2(-2)^n + \alpha_3(2)^n$ .

## Example 3

$$a_n = 4a_{n-2} + 4a_{n-3} - a_{n-1}$$

$$a_0 = 8 \quad a_1 = 6 \quad a_2 = 26$$

**Ex:** Apply the above claim and get the closed form expression.

---

**Sol:**

- Characteristic equation is:  $t^3 + t^2 - 4t - 4 = 0$ .
- Roots are  $r_1 = -1, r_2 = -2, r_3 = 2$ .
- Thus,  $a_n = \alpha_1(-1)^n + \alpha_2(-2)^n + \alpha_3(2)^n$ .
- Use bases cases to get  $\alpha_1 = 2, \alpha_2 = 1$  and  $\alpha_3 = 5$ .

## Beyond Degree Two with repeated roots

## Beyond Degree Two with repeated roots

**Claim:** Let  $c_1, c_2, \dots, c_k$  be constants. Suppose the characteristic equation  $t^k - c_1 t^{k-1} - \dots - c_k = 0$  has  $\ell$  **distinct** roots  $r_1, r_2, \dots, r_\ell$  with multiplicities  $m_1, m_2, \dots, m_\ell$  respectively. Then the sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$$

## Beyond Degree Two with repeated roots

**Claim:** Let  $c_1, c_2, \dots, c_k$  be constants. Suppose the characteristic equation  $t^k - c_1 t^{k-1} - \dots - c_k = 0$  has  $\ell$  **distinct** roots  $r_1, r_2, \dots, r_\ell$  with multiplicities  $m_1, m_2, \dots, m_\ell$  respectively. Then the sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$$

**iff** for  $n = 0, 1, 2$ , we have the following, where  $\alpha_{i,j}$  are constants.

$$a_n = (\alpha_{1,0} + \alpha_{1,1} \cdot n + \dots + \alpha_{1,m_1-1} n^{m_1-1}) \cdot r_1^n$$

## Beyond Degree Two with repeated roots

**Claim:** Let  $c_1, c_2, \dots, c_k$  be constants. Suppose the characteristic equation  $t^k - c_1 t^{k-1} - \dots - c_k = 0$  has  $\ell$  **distinct** roots  $r_1, r_2, \dots, r_\ell$  with multiplicities  $m_1, m_2, \dots, m_\ell$  respectively. Then the sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$$

iff for  $n = 0, 1, 2$ , we have the following, where  $\alpha_{i,j}$  are constants.

$$a_n = \begin{aligned} & (\alpha_{1,0} + \alpha_{1,1} \cdot n + \dots + \alpha_{1,m_1-1} n^{m_1-1}) \cdot r_1^n \\ & + (\alpha_{2,0} + \alpha_{2,1} \cdot n + \dots + \alpha_{2,m_2-1} n^{m_2-1}) \cdot r_2^n \end{aligned}$$

## Beyond Degree Two with repeated roots

**Claim:** Let  $c_1, c_2, \dots, c_k$  be constants. Suppose the characteristic equation  $t^k - c_1 t^{k-1} - \dots - c_k = 0$  has  $\ell$  **distinct** roots  $r_1, r_2, \dots, r_\ell$  with multiplicities  $m_1, m_2, \dots, m_\ell$  respectively. Then the sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$$

iff for  $n = 0, 1, 2$ , we have the following, where  $\alpha_{i,j}$  are constants.

$$\begin{aligned} a_n = & (\alpha_{1,0} + \alpha_{1,1} \cdot n + \dots + \alpha_{1,m_1-1} n^{m_1-1}) \cdot r_1^n \\ & + (\alpha_{2,0} + \alpha_{2,1} \cdot n + \dots + \alpha_{2,m_2-1} n^{m_2-1}) \cdot r_2^n \\ & + \dots + (\alpha_{\ell,0} + \alpha_{\ell,1} \cdot n + \dots + \alpha_{\ell,m_\ell-1} n^{m_\ell-1}) \cdot r_\ell^n \end{aligned}$$

## Beyond Degree Two with repeated roots

**Claim:** Let  $c_1, c_2, \dots, c_k$  be constants. Suppose the characteristic equation  $t^k - c_1 t^{k-1} - \dots - c_k = 0$  has  $\ell$  **distinct** roots  $r_1, r_2, \dots, r_\ell$  with multiplicities  $m_1, m_2, \dots, m_\ell$  respectively. Then the sequence  $a_0, a_1, a_2, \dots$  is a solution to the recurrence

$$a_n = c_1 a_{n-1} + c_2 a_{n-2} + \dots + c_k a_{n-k}$$

iff for  $n = 0, 1, 2$ , we have the following, where  $\alpha_{i,j}$  are constants.

$$\begin{aligned} a_n = & (\alpha_{1,0} + \alpha_{1,1} \cdot n + \dots + \alpha_{1,m_1-1} n^{m_1-1}) \cdot r_1^n \\ & + (\alpha_{2,0} + \alpha_{2,1} \cdot n + \dots + \alpha_{2,m_2-1} n^{m_2-1}) \cdot r_2^n \\ & + \dots + (\alpha_{\ell,0} + \alpha_{\ell,1} \cdot n + \dots + \alpha_{\ell,m_\ell-1} n^{m_\ell-1}) \cdot r_\ell^n \end{aligned}$$

- 
- Note how the degree two repeated case is a special case of the above.
  - Next, we show the claim applied to an example.

## Example 4

$$a_n = 8a_{n-2} - 16a_{n-4} \quad \text{for } n \geq 4$$

$$a_0 = 1 \quad a_1 = 4 \quad a_2 = 28 \quad a_3 = 32$$

**Ex:** Apply the above claim and get the closed form expression.

## Example 4

$$a_n = 8a_{n-2} - 16a_{n-4} \quad \text{for } n \geq 4$$

$$a_0 = 1 \quad a_1 = 4 \quad a_2 = 28 \quad a_3 = 32$$

**Ex:** Apply the above claim and get the closed form expression.

---

**Sol:**

- Characteristic equation is:  $t^4 - 8t^2 + 16 = 0$ .
- Roots are  $r_1 = 2$  with  $m_1 = 2$  and  $r_2 = -2$  with  $m_2 = 2$ .
- Thus,  $a_n = \alpha_1(2)^n + \alpha_2 n(2)^n + \alpha_3(-2)^n + \alpha_4 n(-2)^n$ .

## Example 4

$$a_n = 8a_{n-2} - 16a_{n-4} \quad \text{for } n \geq 4$$

$$a_0 = 1 \quad a_1 = 4 \quad a_2 = 28 \quad a_3 = 32$$

**Ex:** Apply the above claim and get the closed form expression.

---

**Sol:**

- Characteristic equation is:  $t^4 - 8t^2 + 16 = 0$ .
- Roots are  $r_1 = 2$  with  $m_1 = 2$  and  $r_2 = -2$  with  $m_2 = 2$ .
- Thus,  $a_n = \alpha_1(2)^n + \alpha_2 n(2)^n + \alpha_3(-2)^n + \alpha_4 n(-2)^n$ .
- Use bases cases to get  $\alpha_1 = 1$ ,  $\alpha_2 = 2$  and  $\alpha_3 = 0$  and  $\alpha_4 = 1$ .

# Summary

- Linear Homogeneous Recurrence Relations with constant coefficients.

# Summary

- Linear Homogeneous Recurrence Relations with constant coefficients.
- Degree two with repeated roots.

# Summary

- Linear Homogeneous Recurrence Relations with constant coefficients.
- Degree two with repeated roots.
- Beyond Degree two and with repeated roots.

# Summary

- Linear Homogeneous Recurrence Relations with constant coefficients.
- Degree two with repeated roots.
- Beyond Degree two and with repeated roots.
- **Upcoming:** Non-homogeneous case and use of Generating Functions.
