$$\binom{n}{r} = \binom{n}{n-r}$$

Note that the claim can be easily verified by substituting the formula. We show two proofs of the same without using the formula.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

$$\binom{n}{r} = \binom{n}{n-r}$$

Note that the claim can be easily verified by substituting the formula. We show two proofs of the same without using the formula.

• Double Counting proof: Use counting arguments to show that both sides of the identity count the same objects but in two different ways.

(日) (日) (日) (日) (日) (日) (日) (日) (日)

$$\binom{n}{r} = \binom{n}{n-r}$$

Note that the claim can be easily verified by substituting the formula. We show two proofs of the same without using the formula.

- Double Counting proof: Use counting arguments to show that both sides of the identity count the same objects but in two different ways.
- Bijective proof: Establish a bijection (one-to-one onto map) between the objects counted by two sides of the identity.

(日) (同) (目) (日) (日) (0) (0)

$$\binom{n}{r} = \binom{n}{n-r}$$

We give a double counting proof first. Let S be a set with size n and  $A \subseteq S$  where |A| = r.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

$$\binom{n}{r} = \binom{n}{n-r}$$

We give a double counting proof first. Let S be a set with size n and  $A \subseteq S$  where |A| = r.

• By definition,  $\binom{n}{r}$  is the number of subsets of S containing r elements.

▲□▶ ▲□▶ ▲目▶ ▲目▶ 目 めへで

$$\binom{n}{r} = \binom{n}{n-r}$$

We give a double counting proof first. Let S be a set with size n and  $A \subseteq S$  where |A| = r.

• By definition,  $\binom{n}{r}$  is the number of subsets of S containing r elements.

▲□▶▲□▶▲□▶▲□▶ □ のQ@

• Consider the subset A.

$$\binom{n}{r} = \binom{n}{n-r}$$

We give a double counting proof first. Let S be a set with size n and  $A \subseteq S$  where |A| = r.

- By definition,  $\binom{n}{r}$  is the number of subsets of S containing r elements.
- Consider the subset *A*. Note that *A* can be determined (uniquely) by specifying the elements which are not in *A*. That is, by specifying the subset  $\overline{A}$ .

(日) (同) (目) (日) (日) (0) (0)

$$\binom{n}{r} = \binom{n}{n-r}$$

We give a double counting proof first. Let S be a set with size n and  $A \subseteq S$  where |A| = r.

- By definition,  $\binom{n}{r}$  is the number of subsets of S containing r elements.
- Consider the subset *A*. Note that *A* can be determined (uniquely) by specifying the elements which are not in *A*. That is, by specifying the subset  $\overline{A}$ .
- Since A
   *Ā* contains n − r elements (as A contains r elements), there are exactly 
   <sup>n</sup><sub>n-r</sub> subsets of size r.

(日) (同) (目) (日) (日) (0) (0)

$$\binom{n}{r} = \binom{n}{n-r}$$

We now give a bijective proof. Let S be a set of size n.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 善臣 - のへぐ

$$\binom{n}{r} = \binom{n}{n-r}$$

We now give a bijective proof. Let S be a set of size n. Let T be the set of subsets of S of size r. Let Q be the set of subsets of size n - r.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

$$\binom{n}{r} = \binom{n}{n-r}$$

We now give a bijective proof. Let S be a set of size n. Let T be the set of subsets of S of size r. Let Q be the set of subsets of size n - r.

• Let us define a function f from T to Q.

$$f(A) = S \setminus A = \bar{A}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ○ ○ ○

$$\binom{n}{r} = \binom{n}{n-r}$$

We now give a bijective proof. Let S be a set of size n. Let T be the set of subsets of S of size r. Let Q be the set of subsets of size n - r.

• Let us define a function f from T to Q.

$$f(A) = S \setminus A = \bar{A}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ○ ○ ○

• Verify that *f* is one-to-one and onto.

$$\binom{n}{r} = \binom{n}{n-r}$$

We now give a bijective proof. Let S be a set of size n. Let T be the set of subsets of S of size r. Let Q be the set of subsets of size n - r.

• Let us define a function f from T to Q.

$$f(A)=S\setminus A=\bar{A}$$

- Verify that *f* is one-to-one and onto.
- Thus, *f* defines a bijection between the set *T* and *Q*, the sizes of which are given by the left hand side and right hand side of the identity we wish to prove.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ○ ○ ○

$$\binom{n}{r} = \binom{n}{n-r}$$

We now give a bijective proof. Let S be a set of size n. Let T be the set of subsets of S of size r. Let Q be the set of subsets of size n - r.

• Let us define a function f from T to Q.

$$f(A) = S \setminus A = \bar{A}$$

- Verify that f is one-to-one and onto.
- Thus, f defines a bijection between the set T and Q, the sizes of which are given by the left hand side and right hand side of the identity we wish to prove.
- Since we have established a bijection between two finite sets, they have the same number of elements

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ○ ○ ○

$$\binom{n}{r} = \binom{n}{n-r}$$

We now give a bijective proof. Let S be a set of size n. Let T be the set of subsets of S of size r. Let Q be the set of subsets of size n - r.

• Let us define a function f from T to Q.

$$f(A) = S \setminus A = \bar{A}$$

- Verify that *f* is one-to-one and onto.
- Thus, *f* defines a bijection between the set *T* and *Q*, the sizes of which are given by the left hand side and right hand side of the identity we wish to prove.
- Since we have established a bijection between two finite sets, they have the same number of elements.

This completes the proof.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 善臣 - のへぐ

Binomial Theorem: Let x and y be variables and n be a positive integer.

We now revisit the familiar binomial theorem and see interesting applications. Binomial Theorem: Let x and y be variables and n be a positive integer.

 $(x+y)^n =$ 

Binomial Theorem: Let x and y be variables and n be a positive integer.

$$(x+y)^n = \binom{n}{0}x^n + \binom{n}{1}x^{n-1}y + \dots + \binom{n}{n-1}xy^{n-1} + \binom{n}{n}y^n$$

Binomial Theorem: Let x and y be variables and n be a positive integer.

$$(x+y)^n = \binom{n}{0}x^n + \binom{n}{1}x^{n-1}y + \dots + \binom{n}{n-1}xy^{n-1} + \binom{n}{n}y^n$$

To see the correctness, we note the following.

• The terms in the product are of the form  $x^{n-j}y^j$  for  $0 \le j \le n$ .

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

Binomial Theorem: Let x and y be variables and n be a positive integer.

$$(x+y)^n = \binom{n}{0}x^n + \binom{n}{1}x^{n-1}y + \dots + \binom{n}{n-1}xy^{n-1} + \binom{n}{n}y^n$$

To see the correctness, we note the following.

- The terms in the product are of the form  $x^{n-j}y^j$  for  $0 \le j \le n$ .
- The number of terms of the form  $x^{n-j}y^j$  is exactly selecting (n-j) xs from the *n* sums or equivalently selecting j y's from the *n* sums.

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ つ ・

Binomial Theorem: Let x and y be variables and n be a positive integer.

$$(x+y)^{n} = \binom{n}{0}x^{n} + \binom{n}{1}x^{n-1}y + \dots + \binom{n}{n-1}xy^{n-1} + \binom{n}{n}y^{n}$$

To see the correctness, we note the following.

- The terms in the product are of the form  $x^{n-j}y^j$  for  $0 \le j \le n$ .
- The number of terms of the form  $x^{n-j}y^j$  is exactly selecting (n-j) xs from the *n* sums or equivalently selecting j y's from the *n* sums.
- Thus the coefficient of  $x^{n-j}y^j$  is exactly  $\binom{n}{n-j}$  which is also equal to  $\binom{n}{j}$ .

Binomial Theorem: Let x and y be variables and n be a positive integer.

$$(x+y)^{n} = \binom{n}{0}x^{n} + \binom{n}{1}x^{n-1}y + \dots + \binom{n}{n-1}xy^{n-1} + \binom{n}{n}y^{n}$$

To see the correctness, we note the following.

- The terms in the product are of the form  $x^{n-j}y^j$  for  $0 \le j \le n$ .
- The number of terms of the form  $x^{n-j}y^j$  is exactly selecting (n-j) xs from the *n* sums or equivalently selecting j y's from the *n* sums.

• Thus the coefficient of  $x^{n-j}y^j$  is exactly  $\binom{n}{n-j}$  which is also equal to  $\binom{n}{j}$ . Note that this is a combinatorial proof.

Ex: Prove the following:

$$\sum_{k=0}^{n} \binom{n}{k} = 2^{n}$$

$$\binom{n}{0} + \binom{n}{2} + \binom{n}{4} + \dots = \binom{n}{1} + \binom{n}{3} + \binom{n}{5} + \dots$$

For  $1 \le k \le n$ 

$$k\binom{n}{k} = n\binom{n-1}{k-1}$$

We give a **double counting** proof.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

We give a double counting proof. Let S be a set of n elements. We consider counting the pairs of the form (x, A) where A is a subset of S and |A| = k and  $x \in A$ .

(日) (日) (日) (日) (日) (日) (日) (日) (日)

We give a double counting proof. Let S be a set of n elements. We consider counting the pairs of the form (x, A) where A is a subset of S and |A| = k and  $x \in A$ .

• To see that the left hand side of the identity counts this number, we note that we can select a subset of k size in  $\binom{n}{k}$  ways. Once the subset is selected, there are k choices for the item x. Thus the left hand side is justified.

(日) (日) (日) (日) (日) (日) (日) (日) (日)

We give a double counting proof. Let S be a set of n elements. We consider counting the pairs of the form (x, A) where A is a subset of S and |A| = k and  $x \in A$ .

- To see that the left hand side of the identity counts this number, we note that we can select a subset of k size in  $\binom{n}{k}$  ways. Once the subset is selected, there are k choices for the item x. Thus the left hand side is justified.
- Another way to select the pair (x, A) is to first select an element x from S. This can be done in n ways.

(日) (同) (目) (日) (日) (0) (0)

For  $1 \le k \le n$  $k \binom{n}{k} = n \binom{n-1}{k-1}$ 

We give a double counting proof. Let S be a set of n elements. We consider counting the pairs of the form (x, A) where A is a subset of S and |A| = k and  $x \in A$ .

- To see that the left hand side of the identity counts this number, we note that we can select a subset of k size in  $\binom{n}{k}$  ways. Once the subset is selected, there are k choices for the item x. Thus the left hand side is justified.
- Another way to select the pair (x, A) is to first select an element x from S. This can be done in n ways. Once x is selected, we wish to select a k sized subset containing x. We have only n − 1 remaining elements from which we can select a k − 1 sized subset

(日) (日) (日) (日) (日) (日) (日) (日) (日)

For  $1 \le k \le n$  $k \binom{n}{k} = n \binom{n-1}{k-1}$ 

We give a double counting proof. Let S be a set of n elements. We consider counting the pairs of the form (x, A) where A is a subset of S and |A| = k and  $x \in A$ .

- To see that the left hand side of the identity counts this number, we note that we can select a subset of k size in  $\binom{n}{k}$  ways. Once the subset is selected, there are k choices for the item x. Thus the left hand side is justified.
- Another way to select the pair (x, A) is to first select an element x from S. This can be done in n ways. Once x is selected, we wish to select a k sized subset containing x. We have only n − 1 remaining elements from which we can select a k − 1 sized subset (recall, x is already in the set A). Thus, we have 
   <sup>n−1</sup>
   <sub>k−1</sub> ways of selecting the set A containing x.

Two important identities

$$\binom{n+1}{k} = \binom{n}{k-1} + \binom{n}{k}$$

・ロト・日本・モト・モート ヨー つくで

$$\binom{n+1}{k} = \binom{n}{k-1} + \binom{n}{k}$$

You should try a proof by algebraic manipulation.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 善臣 - のへぐ

$$\binom{n+1}{k} = \binom{n}{k-1} + \binom{n}{k}$$

You should try a proof by algebraic manipulation.

We give a combinatorial proof. The LHS is clearly the number of subsets of size k of an n + 1 sized set.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

$$\binom{n+1}{k} = \binom{n}{k-1} + \binom{n}{k}$$

You should try a proof by algebraic manipulation.

We give a combinatorial proof. The LHS is clearly the number of subsets of size k of an n + 1 sized set. To justify that right hand side counts exactly the same, let x be some element of the n + 1 sized set. The k sized subsets either contain x or do not contain x.

$$\binom{n+1}{k} = \binom{n}{k-1} + \binom{n}{k}$$

You should try a proof by algebraic manipulation.

We give a combinatorial proof. The LHS is clearly the number of subsets of size k of an n + 1 sized set. To justify that right hand side counts exactly the same, let x be some element of the n + 1 sized set. The k sized subsets either contain x or do not contain x.

- The number of subsets that contain x is (<sup>n</sup><sub>k-1</sub>). Note that x is selected and therefore we have only n elements to select the k - 1 elements from.
- The number of subsets that do not contain x is <sup>(n)</sup>/<sub>k</sub>, since we have n elements left (excluding x) to choose from and all of k elements to select.

- Write down another path in the above two ways.
- What are the properties of any valid path?

#### Any path must contain exactly m Rs and n Us.

Now write down your answer for the number of distinct paths.

# Summary

- A new technique of proving identities.
- Gives insight rather than only algebriac manipulations.
- Important Identities like the Pascal's Identity and Vandermonde's Identity.
