Outline

Data Types and their Representations

- Want to define new data types.
  - a specification - tells us what data (and what operations on that data) we are trying to represent.
  - implementation - tells us how we do it.
- We want to arrange things so that you can change the implementation without changing the code that uses the data type (user = client; implementation = supplier/server).
- Both the specification and implementation have to deal with two things: the data and the operations on the data.
- Vital part of the implementation is the specification of how the data is represented. We will use the notation $\lceil v \rceil$ for "the representation of data 'v'.

Numbers

- **Data specification**: Non negative numbers.

$$\text{zero} = \lceil 0 \rceil$$

- **operations**:

$$(\text{is-zero? } \lceil n \rceil) = \begin{cases} \#t & n = 0 \\ \#f & n \neq 0 \end{cases}$$

$$(\text{succ } \lceil n \rceil) = \lceil n+1 \rceil$$

$$(\text{pred } \lceil n+1 \rceil) = \lceil n \rceil$$

- **Extensions to do other operations**: Should work irrespective of the underlying representation.

```
(define plus
   (lambda (x y)
      (if (is-zero? x) y
           (succ (plus (pred x) y)))))
```

  - Irrespective of the representation `(plus `$\lceil x \rceil \lceil y \rceil$`)` = $\lceil x+y \rceil$

Scheme Representation of Numbers

$\lceil n \rceil$ = the Scheme integer n

```
(define zero 0)
(define is-zero? zero?)
(define succ (lambda (n) (+ n 1)))
(define prec (lambda (n) (- n 1)))
```

Unary Representation of Numbers

$\lceil 0 \rceil$ ()
$\lceil n+1 \rceil$ = (cons #t $\lceil n \rceil$)

- So the integer n is represented by a list of n #t's.
- Satisfy the specification:

  ```
  (define zero = '())
  ```

  ```
  (define is-zero? null?)
  ```

  ```
  (define succ
    (lambda (n) (cons #t n)))
  ```

  ```
  (define pred cdr)
  ```

Data Representation (contd). Example 2: Finite functions

- **Data specification**: a function whose domain is a finite set of Scheme symbols, and whose range is unspecified.
- **Specification of operation**: *Aka - the interface*

  empty-ff   = $\lceil \phi \rceil$
  (apply-ff $\lceil f \rceil$ *s*)   = $f(s)$
  (extend-ff ***s v*** $\lceil f \rceil$)   = $\lceil g \rceil$

  $$\text{where } g(s') = \begin{cases} v & s' = s \\ f(s') & \text{Otherwise} \end{cases}$$

- Interface gives the type of each procedure and a description of the intended behavior of each procedure.

Procedural Representation

$f = \lceil \{(s_1, v_1), ..., (s_n, v_n)\} \rceil$ iff $(f\ s_i) = v_i$.
Implement the operations by:

```
(define apply-ff
  (lambda (ff z) (ff z)))

(define empty-ff
  (lambda (z)
    (error 'env-lookup
           (format "couldn't find ~s" z))))

(define extend-ff
  (lambda (key val ff)
    (lambda (z)
      (if (eq? z key)
        val
        (apply-ff ff z)))))
```

Procedural Representation

Examples

```
> (define ff-1 (extend-ff 'a 1 empty-ff))
> (define ff-2 (extend-ff 'b 2 ff-1))
> (define ff-3 (extend-ff 'c 3 ff-2))
> (define ff-4 (extend-ff 'd 4 ff-3))
> (define ff-5 (extend-ff 'e 5 ff-4))
> ff-5
<Procedure>
> (apply-ff ff-5 'd)
4
> (apply-ff empty-ff 'c)
error in env-lookup: couldn't find c.
> (apply-ff ff-3 'd)
error in env-lookup: couldn't find d.
>(define ff-new (extend-ff 'd 6 ff-4))
> (apply-ff ff-new 'd)
> 6
```

Association-list Representation

$\lceil \{(s_1, v_1), ..., (s_n, v_n)\} \rceil = ((s_1 . v_1)...(s_n . v_n))$

```
(define empty-ff '())

(define extend-ff
  (lambda (key val ff)
    (cons (cons key val) ff)))

(define apply-ff
  (lambda (alist z)
    (if (null? alist)
        (error 'env-lookup
               (format "couldn't find ~s" z))
        (let ((key (caar alist))
              (val (cdar alist))
              (ff (cdr alist)))
          (if (eq? z key) val (apply-ff ff z)))))))
```

Association-list Representation

Examples

```
> (define ff-1 (extend-ff 'a 1 empty-ff))
> (define ff-2 (extend-ff 'b 2 ff-1))
> (define ff-3 (extend-ff 'c 3 ff-2))
> (define ff-4 (extend-ff 'd 4 ff-3))
> ff-4
((d . 4) (c . 3) (b . 2) (a . 1))
> (apply-ff ff-4 'd)
4
```

Outline

Interpreters

The complexity of Interpreters depend on the language under consideration.

- Simple
- Environments
- Cells
- Closures
- Recursive Environments

Stack machine grammar

- **Goal**: interpreter for a stack machine.
- The machine will have two components: an action and a stack.
- The stack contains the data in the machine.
- We will represent the stack as a list of Scheme values, with the top of the stack at the front of the list.
- The action represents the instruction stream being executed by the machine.
- ```
  Action ::= halt
          | incr; Action
          | add; Action;
          | push Integer ; Action
          | pop; Action
  ```
- Our interpreter - `eval-action`: takes an action and a stack and returns the value produced by the machine at the completion of the action.
- Convention: the machine produces a value by leaving it on the top of the stack when it halts.

Specification of Operations

Specification for `eval-action`. *Our VM*

- What `(eval-action a s)` does for each possible value of `a`.

  ```
  (eval-action halt s) = (car s)

  (eval-action incr; a (v w ...)) =
            (eval-action a (v+1 w ...))

  (eval-action add; a (v w x ...)) =
            (eval-action a ((v+w) x ...))

  (eval-action push v; a (w ...)) =
            (eval-action a (v w ...))

  (eval-action pop; a (v w ...)) =
            (eval-action a (w ...))
  ```
- Is the specification complete? How to prove the same?

Representation of Operations

To write Scheme code to implement the specification of `eval-action`, we need to specify a representation of the type of actions. (*Our bytecode*).

- A simple choice - use lists.

  $\lceil halt \rceil$ = (halt)
  $\lceil incr; a \rceil$ = (incr . $\lceil a \rceil$)
  $\lceil add; a \rceil$ = (add . $\lceil a \rceil$)
  $\lceil push\ v; a \rceil$ = (push v . $\lceil a \rceil$)
  $\lceil pop; a \rceil$ = (pop . $\lceil a \rceil$)

- An action is represented as a list of instructions.
- Typical action is `(push 3 push 4 add halt)`

A Stack Machine Interpreter

```
(define eval-action
  (lambda (action stack)
    (let ((op-code (car action)))
      (case op-code
        ((halt)
         (car stack))
        ((incr)
         (eval-action (cdr action)
           (cons (+ (car stack) 1) (cdr stack))))
        ((add)
         (eval-action (cdr action)
           (cons (+ (car stack) (cadr stack)) (cddr stack))))
        ((push)
         (let ((v (cadr action)))
           (eval-action (cddr action) (cons v stack))))
        ((pop)
         (eval-action (cdr action) (cdr stack)))
        (else
         (error 'eval-action "unknown op-code:" op-code))))))
```

Interpreter in action

Running the Interpreter

```
> (define start
  (lambda (action)
    (eval-action action '())))

> (start '(push 3 push 4 add halt))
7
```

Recap from last class

- A Scope of let and letrec
- B Data types
- C Interpreters

Outline

Interpreters (contd.): Environment

- An environment is a finite function - that maps identifiers to values.
- Why do we need an environment?
- **Specification**:

$$
\begin{array}{lcl}
\texttt{empty-Env} & = & \lceil \phi \rceil \\
(\texttt{apply-Env } \lceil f \rceil \; s) & = & f(s) \\
(\texttt{extend-Env } s \; v \; \lceil f \rceil) & = & \lceil g \rceil
\end{array}
$$

$$
\text{where } g(s') = \left\{ \begin{array}{ll} v & s' = s \\ f(s') & \text{Otherwise} \end{array} \right.
$$

Environment implementation

```
(define empty-env
  (lambda () '()))

(define extend-env
  (lambda (id val env)
    (cons (cons id val) env)))

(define apply-env
  (lambda (env id)
    (if (or (null? env) (null? id))
      null
        (let ((key (caar env))
              (val (cdar env))
              (env-prime (cdr env)))
          (if (eq? id key) val (apply-env env-prime z)))))))

(define extend-env-list
  (lambda (ids vals env) ... )
```

extend-env-list

```
(define extend-env-list
  (lambda (ids vals env)
    (if (null? ids)
        env
        (extend-env-list
          (cdr ids)
          (cdr vals)
          (extend-env (car ids) (car vals) env)))))
```

Home reading: Read Scheme alist representation and see how the above routines can be compacted.

Interpreter with environment

```
(define eval-Expression
  (lambda (Expression)
    (record-case Expression
      ...
      (PlusExpression  (Tkn1 Tkn2 Expression1 Expression2 Tkn3)
        (+ (eval-Expression Expression1)
           (eval-Expression Expression2))))

      (Identifier (Token) (apply-env env Token))
      ... ))

(define run
  (lambda ()
    (record-case root
      (Goal (Expression Token)
        (eval-Expression Expression (empty-env)))
      (else (error 'run ''Goal not found'')))))
```

Extending an environment - let expression

```
(LetExpression (Token1 Token2 Token3
                       List Token4 Expression Token5)
  (let* ((ids  (get-ids List))
         (exps (get-exprs List))
         (vals (map (lambda (Expression)
                      (eval-Expression Expression env))
                    exps))
         (new-env (extend-env-list ids vals env)))
    (eval-Expression Expression new-env)))

> (map cdr '((1 2 3) (3 4 5)))
((2 3) (4 5))
```
Useless assignment: How to interpret Let*?

Outline

Update to variables

- One undesirable feature of Scheme: assignment to variables.
- A variable has a name and address where it stores the value, which can be updated.

  ```
  (define make-cell
    (lambda (value)
      (cons '*cell value)))

  (define deref-cell cdr)

  (define set-cell! set-cdr!)
  ```

- When we extend an environment, we will create a cell, store the initial value in the cell, and bind the identifier to the cell.

  ```
  (define extend-env
    (lambda (id value env)
      (cons (id (make-cell value))
            ...)))
  ```

Example: Interpreting a let expression

```
(let ((x 7))
  (+ (let ((y x)
           (x (+ 2 x)))
         (* x y)) x)
```

Outline

Closures

To represent user-defined procedures, we will use closures.

```
(define-record closure (formals body env))
```

Closures

```
(define eval-Expression
  (lambda (Expression env)
    (record-case Expression
      ...
      (ProcedureExp (Token1 Token2 Token3
                     List Token4 Expression Token5)
        (make-closure List Expression env))
      (Application (Token1 Expression List Token2)
        (let*
          ((clos (eval-Expression Expression env))
           (ids  (get-formals clos))
           (vals (map (lambda (Exp)
                        (eval-Expression Exp env))
                      List))
           (static-env (get-closure-env clos))
           (new-env
             (extend-env-list ids vals static-env)))
           (body (get-body clos))
          (eval-Expression body new-env)))
      ...)))
```

Outline

Recursive Environments for recursive definitions

- We need two kinds of environment records.
  - Normal environments contain cells.
  - A recursive environment contains a RecDeclarationList. If one looks up a recursively-defined procedure, then it gets closed in the environment frame that contains it:

```
(define-record normal-env (ids vals env))

(define-record rec-env (recdecl-list env))

(define eval-Expression
  (lambda (Expression env)
    (record-case Expression
      ...
      (RecExpression (Token1 Token2 Token3
                      List Token4 Expression Token5)
        (eval-Expression
          Expression
          (make-rec-env List env)))
      (else (error ...)))))
```

Recursive environments

```
(define apply-env
 (lambda (env id)
   (record-case env
     ...
     (rec-env (recdecl-list old-env)
       (let ((id-list (get-ids recdecl-list)))
         (if (member id id-list)
           (let* ((RecProcExpr
                    (get-decl id id-list recdecl-list)))

             (make-cell (make-closure  ;; a cell!
                   ProcedureExp env)))
           (apply-env old-env id)))))))
```

Health card

A Environment

B Cells

C Closures

D Recursive environments

Things to Do

- Make sure you have a working account.
- Start brushing on Java and Scheme.
- Review Java development tools.
- Check out the course webpage:
  `http://www.cse.iitm.ac.in/~krishna/cs6848/`, (for the assignment 1 - due on 28th Jan).
