# Module 3.1: Sigmoid Neuron

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

◆□▶ ◆課▶ ◆臣▶ ◆臣▶ 臣 の�?

• Enough about boolean functions!

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

- Enough about boolean functions!
- What about arbitrary functions of the form y = f(x) where  $x \in \mathbb{R}^n$  (instead of  $\{0,1\}^n$ ) and  $y \in \mathbb{R}$  (instead of  $\{0,1\}$ )?

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへの

- Enough about boolean functions!
- What about arbitrary functions of the form y = f(x) where  $x \in \mathbb{R}^n$  (instead of  $\{0,1\}^n$ ) and  $y \in \mathbb{R}$  (instead of  $\{0,1\}$ )?
- Can we have a network which can (approximately) represent such functions ?

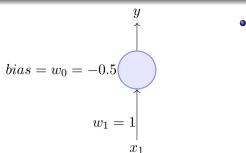

《曰》 《曰》 《曰》 《曰》 [] []

h

- This behavior is not a characteristic of the specific problem we chose or the specific weight and threshold that we chose
- It is a characteristic of the perceptron function itself which behaves like a step function

イロト (局) (日) (日) (日) (の)

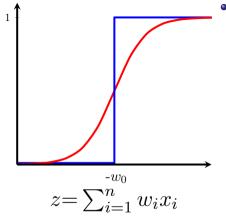

- This behavior is not a characteristic of the specific problem we chose or the specific weight and threshold that we chose
- It is a characteristic of the perceptron function itself which behaves like a step function
- There will always be this sudden change in the decision (from 0 to 1) when  $\sum_{i=1}^{n} w_i x_i$  crosses the threshold  $(-w_0)$

・ロト ・得 ト ・ヨト ・ヨト ・ヨー

$$z = \sum_{i=1}^{-w_0} w_i x_i$$

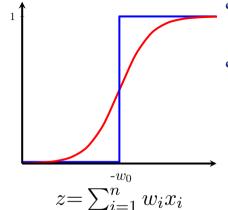

- This behavior is not a characteristic of the specific problem we chose or the specific weight and threshold that we chose
- It is a characteristic of the perceptron function itself which behaves like a step function
- There will always be this sudden change in the decision (from 0 to 1) when  $\sum_{i=1}^{n} w_i x_i$  crosses the threshold  $(-w_0)$
- For most real world applications we would expect a smoother decision function which gradually changes from 0 to 1

 $z = \sum_{i=1}^{-w_0} w_i x_i$ 

• Introducing sigmoid neurons where the output function is much smoother than the step function

◆□▶ ◆圖▶ ◆臣▶ ◆臣▶ ─臣 ─のへで

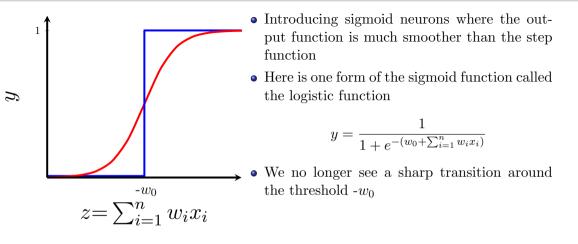

h

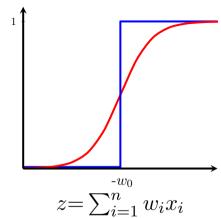

- Introducing sigmoid neurons where the output function is much smoother than the step function
- Here is one form of the sigmoid function called the logistic function

$$y = \frac{1}{1 + e^{-(w_0 + \sum_{i=1}^n w_i x_i)}}$$

イロト (局) (日) (日) (日) (の)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

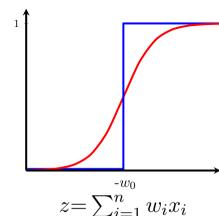

- Introducing sigmoid neurons where the output function is much smoother than the step function
- Here is one form of the sigmoid function called the logistic function

$$y = \frac{1}{1 + e^{-(w_0 + \sum_{i=1}^{n} w_i x_i)}}$$

- We no longer see a sharp transition around the threshold  $-w_0$
- Also the output y is no longer binary but a real value between 0 and 1 which can be interpreted as a probability

・ロト ・得 ト ・ヨト ・ヨト ・ヨー

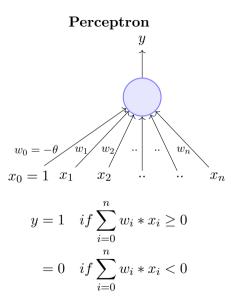

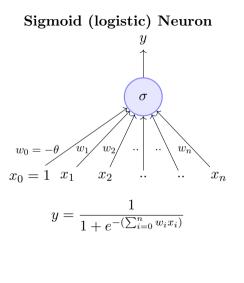

- Introducing sigmoid neurons where the output function is much smoother than the step function
- Here is one form of the sigmoid function called the logistic function

$$y = \frac{1}{1 + e^{-(w_0 + \sum_{i=1}^{n} w_i x_i)}}$$

- We no longer see a sharp transition around the threshold  $-w_0$
- Also the output y is no longer binary but a real value between 0 and 1 which can be interpreted as a probability
- Instead of a like/dislike decision we get the probability of liking the movie

## Module 3.2: A typical Supervised Machine Learning Setup

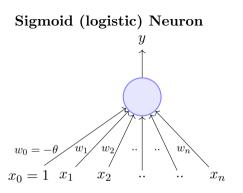

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

#### • What next ?

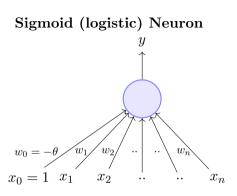

## Sigmoid (logistic) Neuron

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

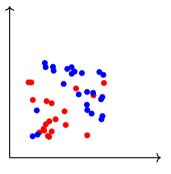

- What next ?
- Well, just as we had an algorithm for learning the weights of a perceptron, we also need a way of learning the weights of a sigmoid neuron

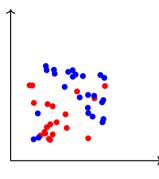

- What next ?
- Well, just as we had an algorithm for learning the weights of a perceptron, we also need a way of learning the weights of a sigmoid neuron
- Before we see such an algorithm we will revisit the concept of **error**

・ロト ・雪ト ・ヨト ・ヨー

• Earlier we mentioned that a single perceptron cannot deal with this data because it is not linearly separable

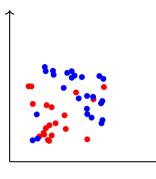

イロト 不得下 イヨト イヨト

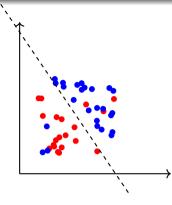

• Earlier we mentioned that a single perceptron cannot deal with this data because it is not linearly separable

• What does "cannot deal with" mean?

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

- Earlier we mentioned that a single perceptron cannot deal with this data because it is not linearly separable
- What does "cannot deal with" mean?
- What would happen if we use a perceptron model to classify this data ?

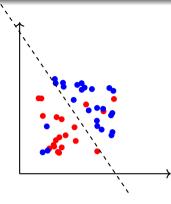

- Earlier we mentioned that a single perceptron cannot deal with this data because it is not linearly separable
- What does "cannot deal with" mean?
- What would happen if we use a perceptron model to classify this data ?

化固定 化压力 化压力

3

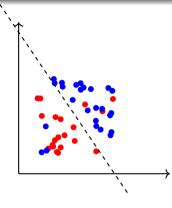

• We would probably end up with a line like this ...

- Earlier we mentioned that a single perceptron cannot deal with this data because it is not linearly separable
- What does "cannot deal with" mean?
- What would happen if we use a perceptron model to classify this data ?

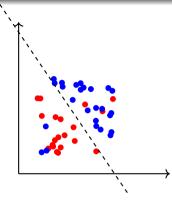

-

- We would probably end up with a line like this ...
- This line doesn't seem to be too bad

- Earlier we mentioned that a single perceptron cannot deal with this data because it is not linearly separable
- What does "cannot deal with" mean?
- What would happen if we use a perceptron model to classify this data ?
- We would probably end up with a line like this ...
- This line doesn't seem to be too bad
- Sure, it misclassifies 3 blue points and 3 red points but we could live with this error in **most** real world applications

-

- Earlier we mentioned that a single perceptron cannot deal with this data because it is not linearly separable
- What does "cannot deal with" mean?
- What would happen if we use a perceptron model to classify this data ?
- We would probably end up with a line like this ...
- This line doesn't seem to be too bad
- Sure, it misclassifies 3 blue points and 3 red points but we could live with this error in **most** real world applications
- From now on, we will accept that it is hard to drive the error to 0 in most cases and will instead aim to reach the minimum possible error

$$\sigma(x) = \frac{1}{1 + e^{-(wx+b)}}$$

With some guess work and intuition we were able to find the right values for w and b

Let us look at something better than our "guess work" algorithm....

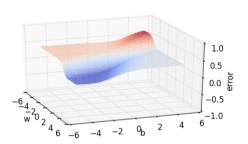

Since we have only 2 points and 2 parameters (w, b) we can easily plot L(w, b) for different values of (w, b) and pick the one where L(w, b) is minimum

Random search on error surface

Since we have only 2 points and 2 parameters (w, b) we can easily plot L(w, b) for different values of (w, b) and pick the one where L(w, b) is minimum

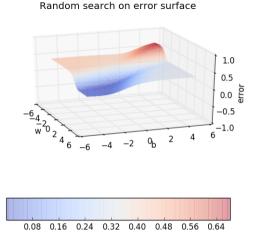

Random search on error surface

- Since we have only 2 points and 2 parameters (w, b) we can easily plot L(w, b) for different values of (w, b) and pick the one where L(w, b) is minimum
- But of course this becomes intractable once you have many more data points and many more parameters !!

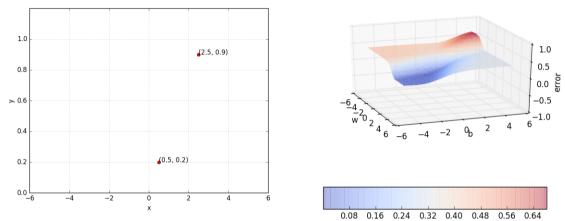

- Since we have only 2 points and 2 parameters (w, b) we can easily plot L(w, b) for different values of (w, b) and pick the one where L(w, b) is minimum
- But of course this becomes intractable once you have many more data points and many more parameters !!
- Further, even here we have plotted the error surface only for a small range of (w, b) [from (-6, 6) and not from  $(-\inf, \inf)$ ]

# $u^T \nabla_{\theta} \mathscr{L}(\theta) < 0$

But, what is the range of  $u^T \nabla_{\theta} \mathscr{L}(\theta)$ ? Let us see.... Let  $\beta$  be the angle between u and  $\nabla_{\theta} \mathscr{L}(\theta)$ , then we know that,

$$-1 \le \cos(\beta) = \frac{u^T \nabla_{\theta} \mathscr{L}(\theta)}{||u|| \ast ||\nabla_{\theta} \mathscr{L}(\theta)||} \le 1$$

# $u^T \nabla_{\theta} \mathscr{L}(\theta) < 0$

But, what is the range of  $u^T \nabla_{\theta} \mathscr{L}(\theta)$ ? Let us see.... Let  $\beta$  be the angle between u and  $\nabla_{\theta} \mathscr{L}(\theta)$ , then we know that,

$$-1 \le \cos(\beta) = \frac{u^T \nabla_{\theta} \mathscr{L}(\theta)}{||u|| \ast ||\nabla_{\theta} \mathscr{L}(\theta)||} \le 1$$

# $u^T \nabla_{\theta} \mathscr{L}(\theta) < 0$

But, what is the range of  $u^T \nabla_{\theta} \mathscr{L}(\theta)$ ? Let us see.... Let  $\beta$  be the angle between u and  $\nabla_{\theta} \mathscr{L}(\theta)$ , then we know that,

$$-1 \le \cos(\beta) = \frac{u^T \nabla_{\theta} \mathscr{L}(\theta)}{||u|| * ||\nabla_{\theta} \mathscr{L}(\theta)||} \le 1$$

multiply throughout by  $k = ||u|| * ||\nabla_{\theta} \mathscr{L}(\theta)||$ 

$$-k \leq k * \cos(\beta) = u^T \nabla_{\theta} \mathscr{L}(\theta) \leq k$$

$$u^T \nabla_{\theta} \mathscr{L}(\theta) < 0$$

But, what is the range of  $u^T \nabla_{\theta} \mathscr{L}(\theta)$ ? Let us see.... Let  $\beta$  be the angle between u and  $\nabla_{\theta} \mathscr{L}(\theta)$ , then we know that,

$$-1 \le \cos(\beta) = \frac{u^T \nabla_{\theta} \mathscr{L}(\theta)}{||u|| * ||\nabla_{\theta} \mathscr{L}(\theta)||} \le 1$$

multiply throughout by  $k = ||u|| * ||\nabla_{\theta} \mathscr{L}(\theta)||$ 

$$-k \le k * \cos(\beta) = u^T \nabla_{\theta} \mathscr{L}(\theta) \le k$$

Thus,  $\mathscr{L}(\theta + \eta u) - \mathscr{L}(\theta) = u^T \nabla_{\theta} \mathscr{L}(\theta) = k * \cos(\beta)$  will be most negative when  $\cos(\beta) = -1$  *i.e.*, when  $\beta$  is 180°

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ● ● ● ● ●

• The direction u that we intend to move in should be at 180° w.r.t. the gradient

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

30/62

- The direction u that we intend to move in should be at 180° w.r.t. the gradient
- In other words, move in a direction opposite to the gradient

- The direction u that we intend to move in should be at 180° w.r.t. the gradient
- In other words, move in a direction opposite to the gradient

#### Parameter Update Equations

$$w_{t+1} = w_t - \eta \nabla w_t$$
  

$$b_{t+1} = b_t - \eta \nabla b_t$$
  

$$where, \nabla w_t = \frac{\partial \mathscr{L}(w, b)}{\partial w}_{at \ w = w_t, b = b_t}, \nabla b = \frac{\partial \mathscr{L}(w, b)}{\partial b}_{at \ w = w_t, b = b_t}$$

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ● ● ● ● ●

## Module 3.5: Representation Power of a Multilayer Network of Sigmoid Neurons

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ● ● ● ● ●

Representation power of a multilayer network of sigmoid neurons

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

A multilayer network of perceptrons with a single hidden layer can be used to represent any boolean function precisely (no errors) Representation power of a multilayer network of sigmoid neurons

◆□▶ ◆母▶ ◆ヨ▶ ◆ヨ▶ ヨー のへで

A multilayer network of perceptrons with a single hidden layer can be used to represent any boolean function precisely (no errors) Representation power of a multilayer network of sigmoid neurons

A multilayer network of neurons with a single hidden layer can be used to approximate any continuous function to any desired precision

◆□▶ ◆母▶ ◆ヨ▶ ◆ヨ▶ ヨー のへで

A multilayer network of perceptrons with a single hidden layer can be used to represent any boolean function precisely (no errors) Representation power of a multilayer network of sigmoid neurons

A multilayer network of neurons with a single hidden layer can be used to approximate any continuous function to any desired precision

In other words, there is a guarantee that for any function  $f(x) : \mathbb{R}^n \to \mathbb{R}^m$ , we can always find a neural network (with 1 hidden layer containing enough neurons) whose output g(x) satisfies  $|g(x) - f(x)| < \epsilon$ !!

◆□▶ ◆母▶ ◆ヨ▶ ◆ヨ▶ ヨー のへで

A multilayer network of perceptrons with a single hidden layer can be used to represent any boolean function precisely (no errors) Representation power of a multilayer network of sigmoid neurons

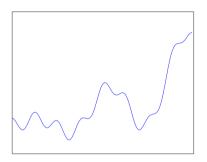

A multilayer network of neurons with a single hidden layer can be used to approximate any continuous function to any desired precision

In other words, there is a guarantee that for any function  $f(x) : \mathbb{R}^n \to \mathbb{R}^m$ , we can always find a neural network (with 1 hidden layer containing enough neurons) whose output g(x) satisfies  $|g(x) - f(x)| < \epsilon$  !!

**Proof:** We will see an illustrative proof of this... [Cybenko, 1989], [Hornik, 1991]

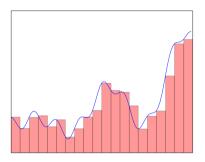

▲□▶ ▲御▶ ▲臣▶ ▲臣▶ ―臣 …のへで

- $\bullet\,$  See this link\* for an excellent illustration of this proof
- The discussion in the next few slides is based on the ideas presented at the above link

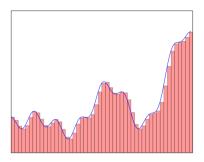

• We are interested in knowing whether a network of neurons can be used to represent an arbitrary function (like the one shown in the figure)

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

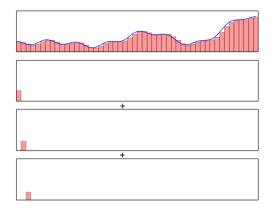

- We are interested in knowing whether a network of neurons can be used to represent an arbitrary function (like the one shown in the figure)
- We observe that such an arbitrary function can be approximated by several "tower" functions

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ● ● ● ● ●

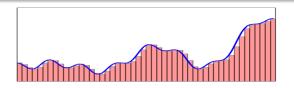

- We are interested in knowing whether a network of neurons can be used to represent an arbitrary function (like the one shown in the figure)
- We observe that such an arbitrary function can be approximated by several "tower" functions
- More the number of such "tower" functions, better the approximation

- We are interested in knowing whether a network of neurons can be used to represent an arbitrary function (like the one shown in the figure)
- We observe that such an arbitrary function can be approximated by several "tower" functions
- More the number of such "tower" functions, better the approximation
- To be more precise, we can approximate any arbitrary function by a sum of such "tower" functions

イロト (日本) (日本) (日本) (日本) (日本)

• We make a few observations

◆□▶ ◆圖▶ ◆臣▶ ◆臣▶ ─臣 ─の�?

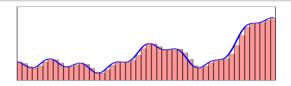

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

- We make a few observations
- All these "tower" functions are similar and only differ in their heights and positions on the x-axis

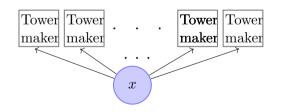

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ● ● ● ● ●

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

- We make a few observations
- All these "tower" functions are similar and only differ in their heights and positions on the x-axis
- Suppose there is a black box which takes the original input (x) and constructs these tower functions

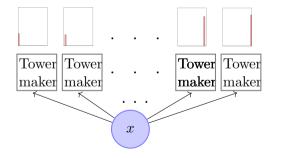

(日本)(日本)(日本)(日本)(日本)

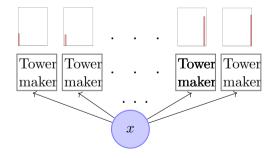

- We make a few observations
- All these "tower" functions are similar and only differ in their heights and positions on the x-axis
- Suppose there is a black box which takes the original input (x) and constructs these tower functions

3

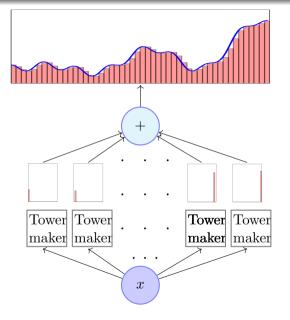

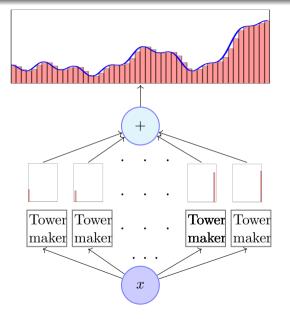

- We make a few observations
- All these "tower" functions are similar and only differ in their heights and positions on the x-axis
- Suppose there is a black box which takes the original input (x) and constructs these tower functions
- We can then have a simple network which can just add them up to approximate the function

-

- We make a few observations
- All these "tower" functions are similar and only differ in their heights and positions on the x-axis
- Suppose there is a black box which takes the original input (x) and constructs these tower functions
- We can then have a simple network which can just add them up to approximate the function

- Now what will we get by adding two such open towers ?
- We get a tower standing on an elevated base
- We can now pass this output through another sigmoid neuron to get the desired tower !
- We can now approximate any function by summing up many such towers

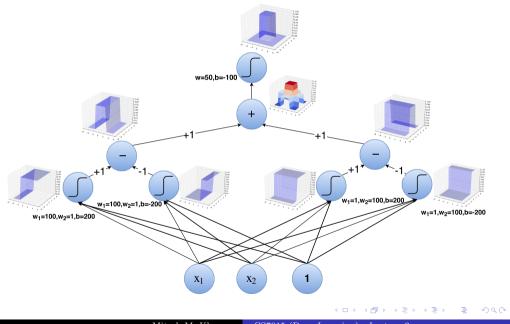

• For example, we could approximate the following function using a sum of several towers

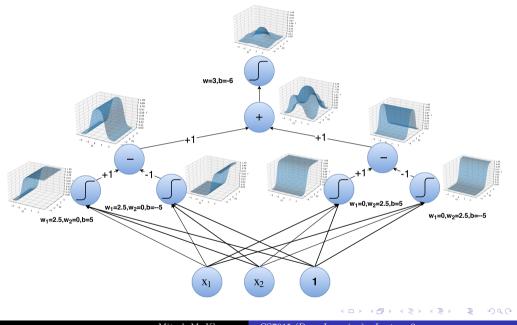

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

• Can we come up with a neural network to represent this entire procedure of constructing a 3 dimensional tower ?

◆□▶ ◆圖▶ ◆臣▶ ◆臣▶ ─臣 ─の�?

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

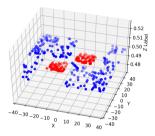

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

## Think

- For 1 dimensional input we needed 2 neurons to construct a tower
- For 2 dimensional input we needed 4 neurons to construct a tower
- How many neurons will you need to construct a tower in n dimensions ?

## Time to retrospect

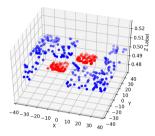

- Why do we care about approximating any arbitrary function ?
- Can we tie all this back to the classification problem that we have been dealing with ?

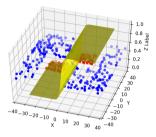

• We are interested in separating the blue points from the red points

Mitesh M. Khapra CS7015 (Deep Learning) : Lecture 3

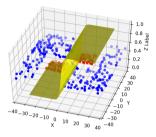

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

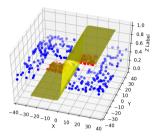

- We are interested in separating the blue points from the red points
- Suppose we use a single sigmoidal neuron to approximate the relation between  $x = [x_1, x_2]$  and y

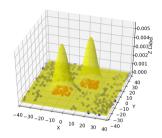

- We are interested in separating the blue points from the red points
- Suppose we use a single sigmoidal neuron to approximate the relation between  $x = [x_1, x_2]$  and y

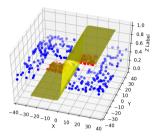

- We are interested in separating the blue points from the red points
- Suppose we use a single sigmoidal neuron to approximate the relation between x = [x<sub>1</sub>, x<sub>2</sub>] and y
- Obviously, there will be errors (some blue points get classified as 1 and some red points get classified as 0)

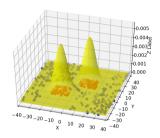

- We are interested in separating the blue points from the red points
- Suppose we use a single sigmoidal neuron to approximate the relation between x = [x<sub>1</sub>, x<sub>2</sub>] and y
- Obviously, there will be errors (some blue points get classified as 1 and some red points get classified as 0)

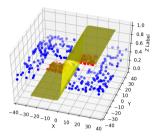

• This is what we actually want

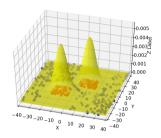

- We are interested in separating the blue points from the red points
- Suppose we use a single sigmoidal neuron to approximate the relation between x = [x<sub>1</sub>, x<sub>2</sub>] and y
- Obviously, there will be errors (some blue points get classified as 1 and some red points get classified as 0)

- This is what we actually want
- The illustrative proof that we just saw tells us that we can have a neural network with two hidden layers which can approximate the above function by a sum of towers

- We are interested in separating the blue points from the red points
- Suppose we use a single sigmoidal neuron to approximate the relation between x = [x<sub>1</sub>, x<sub>2</sub>] and y
- Obviously, there will be errors (some blue points get classified as 1 and some red points get classified as 0)

- This is what we actually want
- The illustrative proof that we just saw tells us that we can have a neural network with two hidden layers which can approximate the above function by a sum of towers
- Which means we can have a neural network which can exactly separate the blue points from the red points !!
