Streams

Rupesh Nasre.

OOAIA
January 2020

I/O

- Input stream
  - istream cin
  - Defaults to keyboard / stdin
- Output stream
  - ostream cout
  - Defaults to console / stdout
- Uses header <iostream>
- cin and cout are objects.
  - >> and << are overloaded.

```
#include <iostream>

int main() {
        std::string name;
        std::cout << "Enter your name: ";
        std::cin >> name;
        std::cout << "Hello " << name << "!\n";

        return 0;
}
```

cin

- By default, reads whitespace-separated formatted tokens.
  - But be careful with `char` and `string`.
- Example stream: 12 17.3 -19

```
int A, B;
double X;
cin >> A;   12
cin >> X;   17.3
cin >> B;   -19
```

```
int A, B;
char X;
cin >> A;  12
cin >> B;  17
cin >> X;  '.'
cin >> A;  3
```

```
int A;
char B, C, D;
cin >> A;  12
cin >> B;  '1'
cin >> C;  '7'
```

```
string A, B, C;
cin >> A;  "12"
cin >> B;  "17.3"
cin >> C;  "-19"
```

ignore

- cin ignores the leading whitespace.
- One can ignore input until a character of relevance is seen.
  - cin.**ignore**(N, ch); // skip upto N or till ch is seen.
  - Useful for ignoring a line (ch = '\n')

```
cout << "Enter your name: ";
cin.ignore(2, 'A');

cin >> name;        // ABCD
cout << name;       // BCD
```

```
cout << "Enter your name: ";
cin.ignore(2, 'Z');

cin >> name;        // ABCD
cout << name;       // CD
```

cout

- Uses buffered output
  - \n can be printed with endl.
  - May not print to screen.
  - To force, use cout << flush.
  - endl involves flush.

```
#include <iostream>

int main() {
        std::string name;
        std::cout << "Enter your name: ";
        std::cin >> name;
        std::cout << "Hello " << name << endl;

        return 0;
}
```

File streams

- #include <fstream>
  - ifstream and ofstream

What is the output?

What is the issue?

stream4.cpp

```
#include <iostream>
#include <fstream>
using namespace std;

int main() {
        ifstream file("stream4.cpp");
        string word;
        while (!file.eof()) {
                file >> word;
                cout << word;
        }

        file.close();   // optional
        return 0;
}
```

#include<iostream>#include<fstream>usingnamespacestd;intmain()
{ifstreamfile("stream4.cpp");stringword;while(!file.eof())
{file>>word;cout<<word;}file.close();//optionalreturn0;}}

ifstream

- **Issue**: Last line is read twice.
- **Solution**: read precedes eof.

stream4.cpp

```
#include <iostream>
#include <fstream>
using namespace std;

int main() {
        ifstream file("stream4.cpp");
        string word;
        file >> word;
        while (!file.eof()) {
                cout << word;
                file >> word;
        }

        file.close();   // optional
        return 0;
}
```

#include<iostream>#include<fstream>usingnamespacestd;intmain()
{ifstreamfile("stream4.cpp");stringword;while(!file.eof())
{file>>word;cout<<word;}file.close();//optionalreturn0;}

cat

- What is the output?

```
#include <iostream>
#include <fstream>
using namespace std;

int main() {
        ifstream file("stream4.cpp");
        string line;
        getline(file, line);
        while (!file.eof()) {
                cout << line;
                getline(file, line);
        }

        file.close();   // optional
        return 0;
}
```

#include <iostream>#include <fstream>using namespace std;int main() { ifstream file("stream4.cpp"); string word; while (!file.eof()) { file >> word; cout << word; } file.close(); // optional return 0;}

cat

- What is the output?

```
#include <iostream>
#include <fstream>
using namespace std;

int main() {
	ifstream file("stream4.cpp");
	string word;
	while (!file.eof()) {
		file >> word;
		cout << word;
	}

	file.close();	// optional
	return 0;
}
```

```
#include <iostream>
#include <fstream>
using namespace std;

int main() {
	ifstream file("stream4.cpp");
	string line;
	getline(file, line);
	while (!file.eof()) {
		cout << line << endl;
		getline(file, line);
	}

	file.close();	// optional
	return 0;
}
```

cp

- a.out <inputfile> <outputfile>

```
#include <iostream>
#include <fstream>
#include <stdlib.h>
using namespace std;

int main(int argc, char *argv[]) {
        ifstream iifile(argv[1]);
        ofstream oofile(argv[2]);
        string line;
        getline(iifile, line);
        while (!iifile.eof()) {
                oofile << line << endl;
                getline(iifile, line);
        }

        return 0;
}
```

cp

- a.out <inputfile> <outputfile>

```
#include <iostream>
#include <fstream>
#include <stdlib.h>
using namespace std;

int main(int argc, char *argv[]) {
	if (argc != 3) {
		cerr << "Usage: " << argv[0] << " <inputfile> <outputfile>" << endl;
		exit(1);
	}
	ifstream iifile(argv[1]);
	ofstream oofile(argv[2]);
	string line;
	getline(iifile, line);
	while (!iifile.eof()) {
		oofile << line << endl;
		getline(iifile, line);
	}

	return 0;
}
```

```
#include <iostream>
#include <fstream>
#include <stdlib.h>
using namespace std;

int main(int argc, char *argv[]) {
	if (argc != 3) {
		cerr << "Usage: " << argv[0] << " <inputfile> <outputfile>" << endl;
		exit(1);
	}
	ifstream iifile(argv[1]);
	if (iifile.fail()) {
		cerr << "File " << argv[1] << " could not be opened." << endl;
		exit(2);
	}
	ofstream oofile(argv[2]);
	string line;
	getline(iifile, line);
	while (!iifile.eof()) {
		oofile << line << endl;
		getline(iifile, line);
	}

	return 0;
}
```

Formatted I/O

data.txt

```
Name: Roll Number: Marks
John Augustine: CS12D001: 88
Madhu Mutyam: CS11D111: 89
Rupesh Nasre: CS13B000: 25
```

```
#include <iostream>
#include <fstream>
using namespace std;

int main() {
        ifstream file("data.txt");
        string name, roll, marks;

        getline(file, name, ':');
        while (!file.eof()) {
            getline(file, roll, ':');
            getline(file, marks, '.');

            cout << name << ":::" << roll << ":::" << marks << endl;
            getline(file, name, ':');
        }
        return 0;
}

                getline(file, name, ':');
        }
        return 0;
}
```

Other functions

- **setprecision**: for floating point values.
- **get**: to read a single character.
- **peek**: to examine a character without removing it from the stream.
- **putback**: add to the stream.
